WHAT IS CLAIMED IS:

	1.	Α	in elec	trical	l pov	ver c	onv	ersio	n sysi	em c	omp	orisii	ng:		
	a loa	ad rec	ceiver	for p	oowe	ering	and	cont	rollin	g loa	ds, s	said	load	rece	iver
compr	ising:														

a decoupler for decoupling a communication signal from an electrical power bus, said communication signal containing encoded load information, wherein the decoupler electrically isolates the communication signal from the power signal;

a data receiver for receiving the communication signal from the decoupler and deriving data therefrom;

a data decoder for decoding data received from the data receiver and converting it to a converter signal according to the encoded load information; and

a power converter for receiving the converter signal from the data decoder, wherein the power converter converts an electrical power bus input of a first voltage into a power output at a second voltage for powering the loads.

2. An electrical power conversion system according to claim 1, further comprising:

a load transmitter for transmitting encoded load information in a communication signal onto the electrical power bus, said load transmitter comprising:

a data encoder for encoding load information into data;

a data transmitter for receiving the data from the data encoder and transmitting a communication signal; and

a coupler for receiving the communication signal from the data transmitter and coupling the communication signal onto the electrical power bus.

10

- 3. An electrical power conversion system according to claim 1, wherein: the load information contains load state and load address information; and further wherein the power converter sets the state of the load according to the converter signal when the power converter is powering the load associated with that load address.
- 4. An electrical power conversion system according to claim 2, wherein the load information contains load state and load address information; and further wherein the power converter sets the state of the load according to the converter signal when the power converter is powering the load associated with that load address.
- 5. An electrical power conversion system according to claim 2 further comprising:
- a data encoder for encoding return load information from the power converter or the load;
- a load return transmitter for transmitting return load data from the data encoder;
- a coupler for coupling communication data received from the load return transmitter to the electric power bus.
- 6. An electrical power conversion system according to claim 5, wherein the load information contains load state and load address information; and further wherein the power converter sets the state of the load according to the converter signal when the power converter is powering the load associated with that load address.
- 7. An electrical power conversion system according to claim 1 for powering vehicle loads, wherein the first voltage is about thirty-six volts to forty-two volts (36V-42V) and the second voltage is about twelve volts to fourteen volts (12V-14V).

35

5

- 8. An electrical power conversion system according to claim 2 for powering vehicle loads, wherein the first voltage is about thirty-six volts to forty-two volts (36V-42V) and the second voltage is about twelve volts to fourteen volts (12V-14V).
- 9. An electrical power conversion system according to claim 3 for powering vehicle loads, wherein the first voltage is about thirty-six volts to forty-two volts (36V-42V) and the second voltage is about twelve volts to fourteen volts (12V-14V).
- 10. An electrical power conversion system according to claim 4 for powering vehicle loads, wherein the first voltage is about thirty-six volts to forty-two volts (36V-42V) and the second voltage is about twelve volts to fourteen volts (12V-14V).
- 11. An electrical power conversion system according to claim 5 for powering vehicle loads, wherein the first voltage is about thirty-six volts to forty-two volts (36V-42V) and the second voltage is about twelve volts to fourteen volts (12V-14V).
- 12. An electrical power conversion system according to claim 6 powering vehicle loads, wherein the first voltage is about thirty-six volts to forty-two volts (36V-42V) and the second voltage is about twelve volts to fourteen volts (12V-14V).
- 13. An electrical power conversion system for powering vehicle loads, comprising:
- a load transmitter for transmitting encoded load information in a communication signal onto a vehicle electrical power bus operating at about thirty-six volts to forty-two volts (36V-42V) DC, said load transmitter comprising:
 - a data encoder for encoding load state and load address information into encoded data;

	and
	a load receiver for controlling vehicle loads and providing said vehicle loads
	with electrical power at about twelve volts to fourteen volts (12V-14V), said load
10	receiver comprising:
ener,	a decoupler for decoupling the FSK communication signal from an
	electrical power bus, said FSK communication signal containing encoded load
4.] 4.]	state and load address information, wherein the decoupler electrically isolates
15	the communication signal from the power signal;
	a frequency shift keying receiver for receiving the FSK communication
15	signal from the decoupler and deriving encoded data from the FSK
	communication signal;
20	a data decoder for decoding the encoded data received from the
	frequency shift keying receiver and converting it into a converter signal
erif	according to the decoded load state and load address information; and
	a power converter for converting the vehicle electrical bus power
25	signal of about thirty-six volts to forty-two volts (36V-42V) DC into a load
	power output equivalent to about twelve volts to fourteen volts (12V-14V) for
	powering vehicle electrical loads, wherein the power converter sets the state
	of a load in accordance with the converter signal when the power converter is
30	powering a load associated with that load address.
	14. An electrical power conversion system for a vehicle electrical system
	according to claim 13, wherein the power converter contains a DC-to-DC converter.
35	

a frequency shift keying transmitter for receiving the encoded data

a coupler for coupling the FSK communication signal onto the vehicle

from the data encoder and transmitting the encoded data as an FSK

communication signal; and

electrical power bus;

15.

according to claim 13, wherein the power converter contains a DC-to-AC inverter.

An electrical power conversion system for a vehicle electrical system

35

16. An electrical power conversion system for powering vehicle loads, comprising:

a load transmitter for transmitting encoded load information in a communication signal onto a vehicle electrical power bus operating at about thirty-six volts to forty-two volts (36V-42V) DC, said load transmitter comprising:

a data encoder for encoding load state information and load address information into encoded data;

a frequency shift keying transmitter for receiving the encoded data from the data encoder and transmitting the encoded data as an FSK communication signal onto a vehicle communication bus;

and

a load receiver for controlling vehicle loads and providing said vehicle loads with electrical power at about twelve volts to fourteen volts (12V-14V), said load receiver comprising:

a frequency shift keying receiver for receiving the communication signal from the vehicle communication bus and deriving encoded data from the FSK communication signal;

a data decoder for decoding the encoded data received from the frequency shift keying receiver and converting it into a converter signal according to the decoded load state and load address information; and

a power converter for converting the vehicle electrical bus power signal of about thirty-six volts to forty-two volts (36V-42V) DC into a load power output equivalent to about twelve volts to fourteen volts (12V-14V) for powering vehicle electrical loads, wherein the power converter sets the state of a load in accordance with the converter signal when the power converter is powering a load associated with that load address.

- 17. An electrical power conversion system for a vehicle electrical system according to claim 16, wherein the power converter contains a DC-to-DC converter.
- 18. An electrical power conversion system for a vehicle electrical system according to claim 16, wherein the power converter contains a DC-to-AC inverter.
